

BioXfill • gel coat

BioXfill Gel Coat is a light cure one component varnish which light cure hard without any smear layer. Chemically it is based on multifunctional composites

- acrylates, it's preferred use it for sealing and improves surfaces of temporary crowns or bridges based on acrylic
- composites systems, full or partial dentures, orthodontic devices and light cure custom trays.

Properties

The special properties of Gel Coat are its full dry surface without leaving a smear layer after light polymerisation, its hard high gloss surface and its more abrasion resistant surface.

The resistance of the covered device will even be improved against solvation by some denture cleaning agents and against

deposition of food rests and plaque, which is advantageous for patient.

Application: on all dental prothesis for seal and shining any type of surface.
